

Alternative Energy & Clean Technology

The energy industry continues to experience rapid changes as society becomes more and more aware of conservation, pollution, and the efficient use of scarce resources. New ways to harness and store energy are being discovered and improved upon at an amazing pace, and the innovators in this field understand the need to move quickly to protect their valuable intellectual property.

Attorneys at COJK have worked as engineers and researchers in the energy and clean-tech industries. This real-world experience provides us with a deep understanding of the challenges clean-tech companies face, and with the ability to deliver the legal counsel that is required to secure IP rights.

COJK attorneys have advised clients in a range of emerging energy technologies, including:

- Agriculture land management
- Air and environment clean up/safety, monitoring and compliance
- Energy efficiency lighting, power control systems, efficient buildings
- Energy generation biofuels, fuel cells, hydropower, nuclear, solar-thermal, solar-electric, geothermal, wind
- Energy storage thermal, thermochemical, flow batteries, fuel cells, compressed air energy storage, hybrid energy storage
- Manufacturing/industrial advanced packaging, monitoring and control systems
- Materials nanotechnology
- Recycling and waste treatment
- Transportation logistics, nuclear fuel, vehicles/fuels
- Water and wastewater anaerobic treatment process, wastewater treatment

Our attorneys hold degrees in chemistry, biology, electrical engineering, computer science, and mechanical

engineering, including many advanced degrees. This academic background, combined with a depth of industry

experience, provides the strong technical foundation that allows us to align our clients' intellectual property needs

with the required technical and legal skills.

Specific examples of our work in the clean-tech area include:

Algae-based biofuel technology

Cellulosic and other biomass production

· Conversion of animal fat into biodiesel

• Development of photovoltaic cells

• Development of synthetic enzymes for biofuels

• Flow battery energy storage

• Fresh water capture systems

• Grid-scale advanced energy storage systems

Hybrid motors and control systems

• Hydrogen storage fuel cells

Advanced internal combustion engine design

· Methanol fuel cells

Nanophotonics

• Smart power grids and efficient control systems for power stations

• Tidal energy generator technology

Wind turbine blade design

Christensen O'Connor Johnson Kindness PLLC
